

The dashboard displays the following metrics:

- Elements:** 5460
- Worksets:** 6
- Categories:** 16
- Families:** 49
- Types:** 56
- Levels:** 4
- Unique Warnings:** 7
- Instances:** 7
- Views/Sheets:** 35
- Worksheets:** 2
- Sheets:** 33
- Views (all):** 6
- Views on Sheets:** 0
- View Templates:** 3
- Linked Models:** 1
- Worksets:** 2
- Folder Paths:** 2

Mass Summary:

Attribute	Value	Units
Areal: 1012805	1,700.00	m²
Gross Floor Areal: 1012004	5,018.00	m²
Gross Surface Areal: 1012006	7,035.00	m²
Gross Volume: 1012007	20,844.51	m³
Volume: 1012806	55,442.02	m³
Total		

List of Elements:

Workset	Elements	Qty (%)
Rectangular Mullion	1,487	28.0%
System Panel	1,197	21.9%
M Concrete Round Column	154	2.8%
M Corner Mullion	130	2.4%
M Single Flush	79	1.4%
M Chair Escut	68	1.2%
SHADE SUPPORT	40	0.7%
M Baluster - Round	36	0.7%
Pendant Light - Linear - 1 Lamp	30	0.5%
M Parking Space	27	0.5%
M Field	24	0.4%
M X Series Bar Joint Angle Weld	23	0.4%
M Table-Driving Round w Chair	15	0.3%
Total	5,460	100.0%

JUNE 15, 2022

Creating an Actionable Revit Model Health Dashboard using Dynamo and Power BI

James Feracor, Digital Design Technologist
Sean McDonald, Corporate BIM Manager
Kristopher Dane, Director of Digital Design

Digital Built Week Americas 2022
 Anaheim, California

Thornton Tomasetti

1

OUTLINE

- Introduction

2

INTRODUCTION

Digital Design (D2) at Thornton Tomasetti

Why?

So project teams can do work that is worth their time; to focus on high value, high impact problems rather than the commodity activities.

Thornton Tomasetti

3

3

INTRODUCTION

Presenters

Dr. Kristopher Dane
Director of Digital Design
Seattle, WA

Sean McDonald
Corporate BIM Manager
Chicago, IL

Dr. James Feracor
Digital Design Technologist
Seattle, WA

We're hosting another session tomorrow at 10:45am:
3.2.08 "AirTable for Version Tracking of Revit Details"

Thornton Tomasetti

4

4

THE PROBLEM

Model Review is Hard

- Checking Revit models is resource intensive!
 - Time-consuming, tedious, and inconsistent when performed manually
 - Not easy to query / search elements in model using Revit UI... and tons of elements!
- Need ability to diagnose model health quickly, consistently, on demand
- Checks yield info valuable in diagnosing potential model issues / measuring model health

Some questions for models

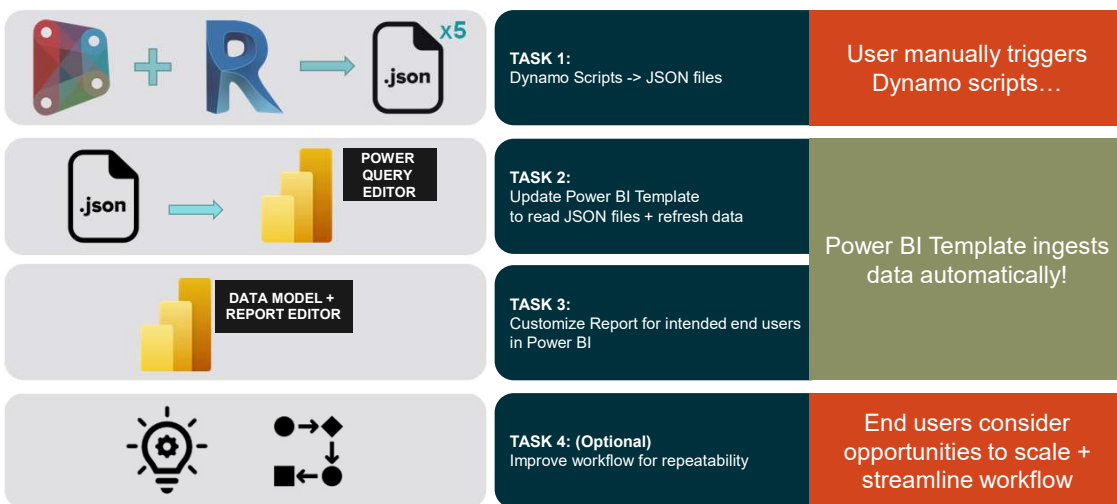

- How many sheets do I have?
- How many views are on sheets?
- Are the right kinds of things in the right views?
- Are objects in the correct worksets?
- How much and what kind of stuff so I have in my model?
- What are the design quantities of the model elements?
- Can I dump model data to Excel for further analysis?

Thornton Tomasetti

5

5

THE SOLUTION

Thornton Tomasetti

We're going to make solution available to all of you (via GitHub)!

6

6

LIVE DEMO

7

REVIT MODEL

8

THE MODEL

[Revit Sample Models](#)

Thornton Tomasetti

9

9

DYNAMO SCRIPTS

10

WHY DYNAMO

- **Why Dynamo**
 - Its free and installed with Revit
 - “Easily” modifiable
- **Drawbacks to Dynamo**
 - It can be slow
 - It needs to be run manually
 - It can be prone to issues
 - Issues can be machine specific
 - You can’t stop a run without killing Revit

Thornton Tomasetti

11

11

REQUIREMENTS

- **Packages**
 - JsonData
Exporting Revit data to JSON
 - Archi-lab.net
Element selector
Linked model info
- **Sample Files**
 - Creating using the Autodesk Revit Architecture and Structure sample files (both basic and advanced)
 - Modified slightly and linked to make the data export slightly more realistic
- **Revit**
 - Sample made using 2022.1.2

Packages			
	Name	Path	Version
✓	JsonData	C:\Users\smcdonald\AppData\Roami	2.0.2
✓	archi-lab.net	C:\Users\smcdonald\AppData\Roami	2022.212.3222

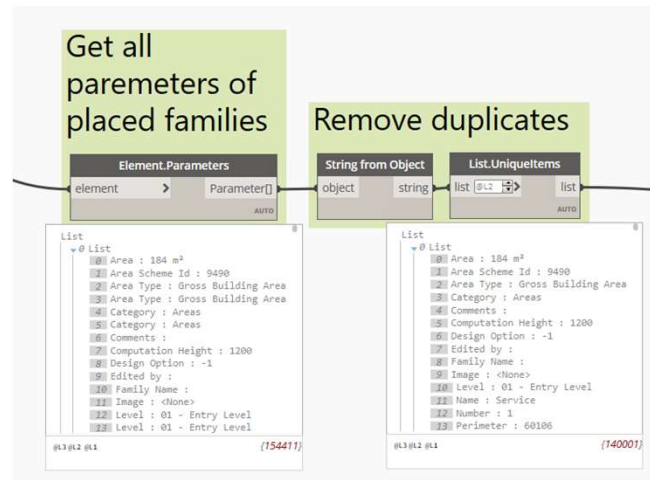

Thornton Tomasetti

12

12

SCRIPT 1 | ELEMENT DATA

- Get all parameters from the list of elements
- Convert to string and remove duplicate items

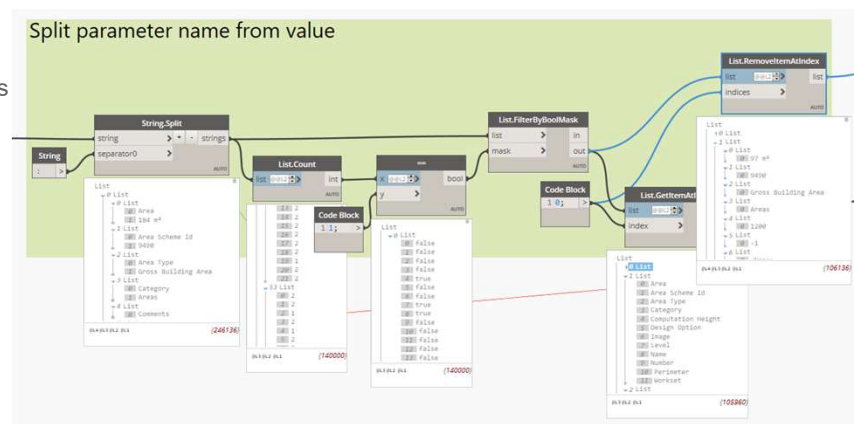

Thornton Tomasetti

15

15

SCRIPT 1 | ELEMENT DATA

- Split the parameter fields at the : to get the Parameter and the Value
- Using the count of elements in the list, empty values can be filtered out
- Both grabbing and removing the elements at index 0 will create the 2 lists (parameters and values)

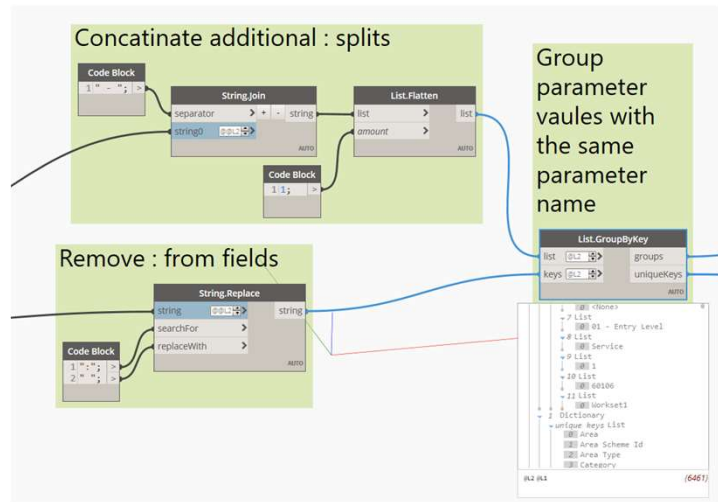

Thornton Tomasetti

16

16

SCRIPT 1 | ELEMENT DATA

- Join any values that may have been split
- Remove any : left in the parameter name
- Group all the values by parameter name

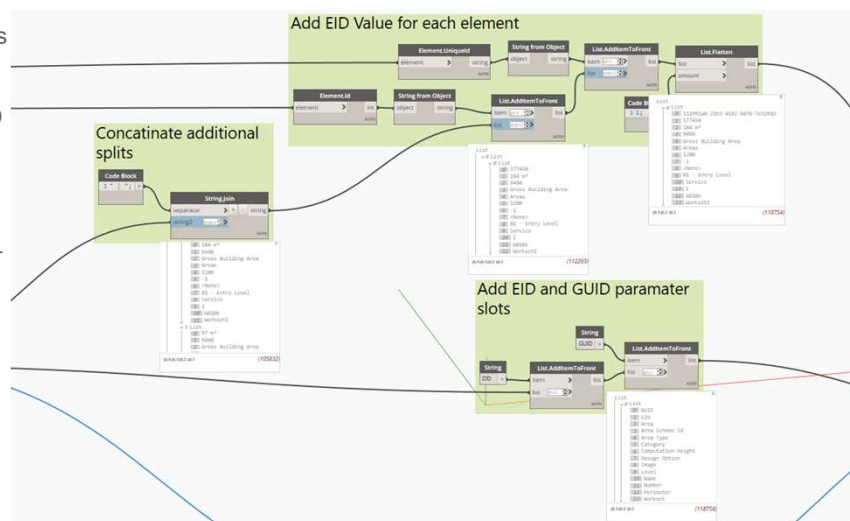

Thornton Tomasetti

17

17

SCRIPT 1 | ELEMENT DATA

- Join the values for parameters with the same name
- Add the element ID and GUID values to the front of each element
- Add the elements ID and GUID keys to each parameter list

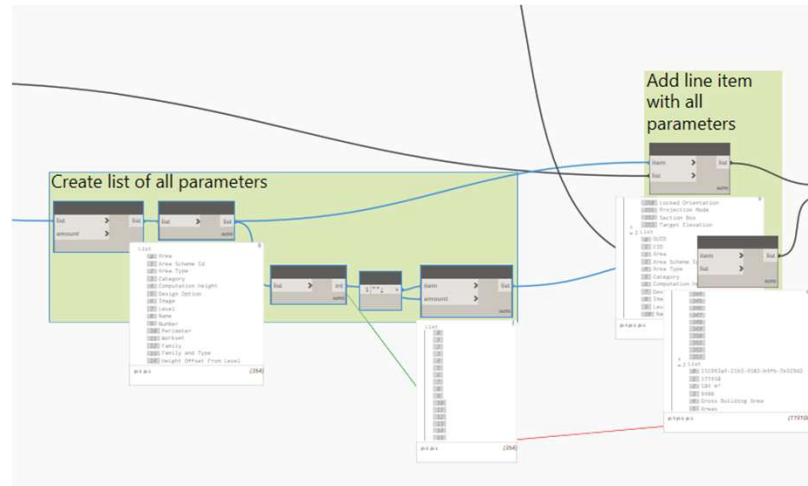

Thornton Tomasetti

18

18

SCRIPT 1 | ELEMENT DATA

- Create a list of all parameters
- Create blank values for the list of parameters
- Add these to the front of the values and keys lists

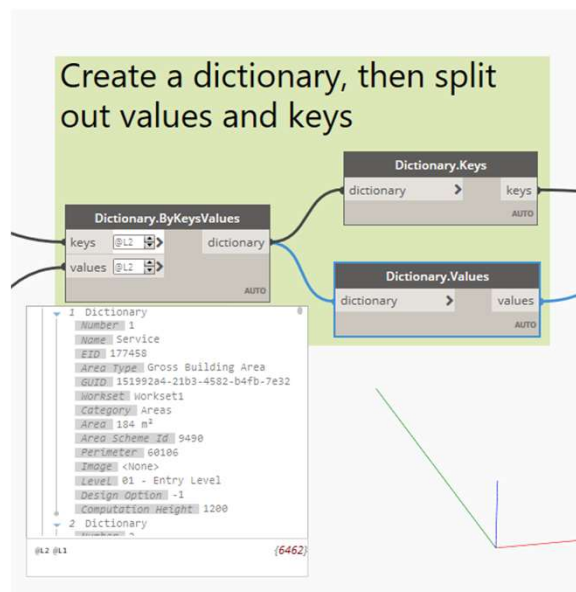

Thornton Tomasetti

19

19

SCRIPT 1 | ELEMENT DATA

- Create a dictionary with the parameter names and parameter values
- Grab the dictionary Keys and Values

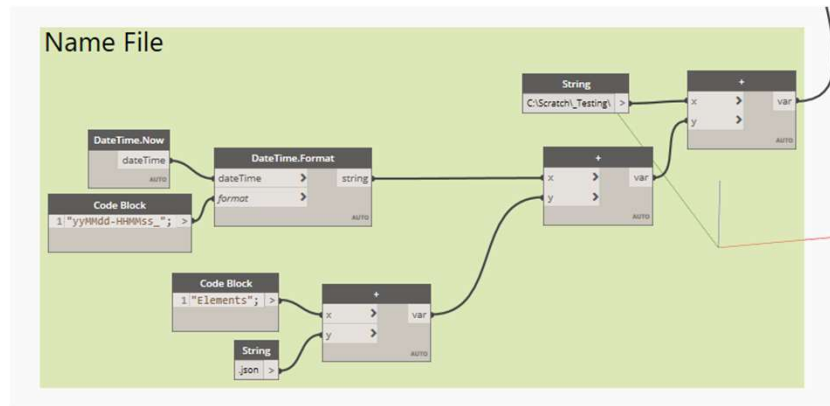

Thornton Tomasetti

20

20

SCRIPT 1 | ELEMENT DATA

- Create a file name and path string

Thornton Tomasetti

21

21

SCRIPT 1 | ELEMENT DATA

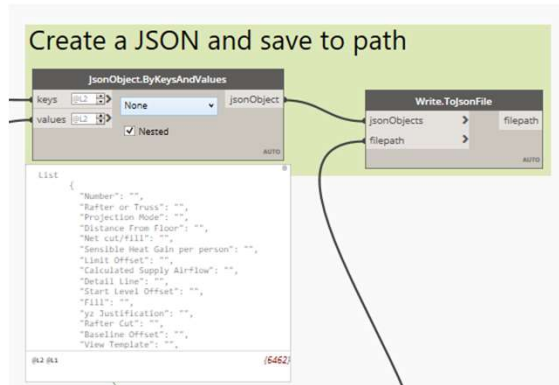

- Convert dictionary keys and values to a JSON object
- Write out the JSON

```

200 | "Project Address": "",
201 | "Top Level": ""
202 |
203 | "Subsets": [
204 |   "Name": "Structure",
205 |   "EID": "177450",
206 |   "Area Type": "Roof Building Area",
207 |   "EID": "151924-2183-652-042B-7a329420e450-0028582",

223 |   "Subsets": "Maxwell",
224 |   "Category": "Area",
225 |   "Area Scheme": "10",
226 |   "Perimeter": "10104",
227 |   "Design": "None",
228 |   "Level": "N1 - Entry Level",
229 |   "Design Option": "1",
230 |   "Computation Height": "1200"
231 | ],
232 |
233 | "Subsets": [
234 |   "Name": "Circulation",
235 |   "EID": "177450",
236 |   "Area Type": "Roof Building Area",
237 |   "EID": "151924-2183-652-042B-7a329420e450-0028582",
238 |   "Subsets": "Maxwell",
239 |   "Category": "Area",
240 |   "Area Scheme": "10",
241 |   "Perimeter": "10104",
242 |   "Design": "None",
243 |   "Level": "N1 - Entry Level",
244 |   "Design Option": "1",
245 |   "Computation Height": "1200"
246 | ],
247 |
248 | ]

```

Thornton Tomasetti

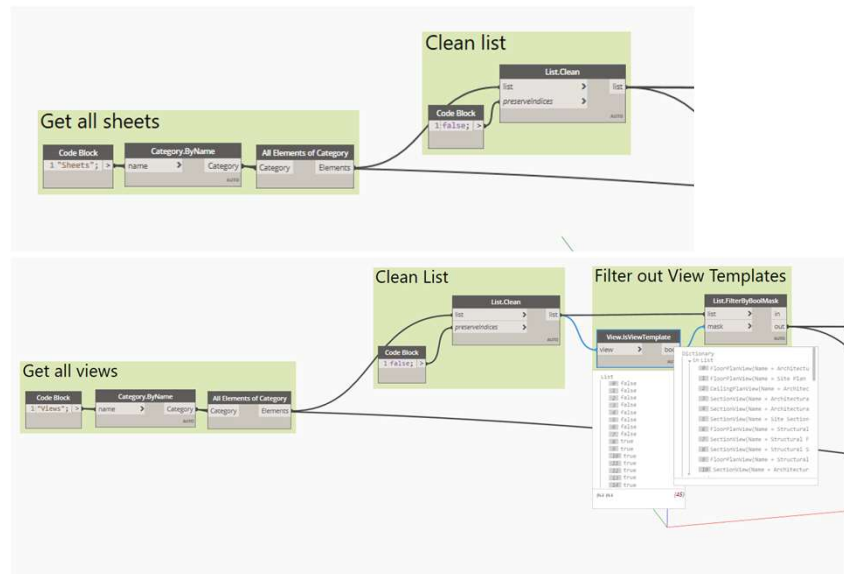

22

22

SCRIPT 2 | SHEET / VIEW

- Select by category for both views and sheets
- For views, filter our view templates

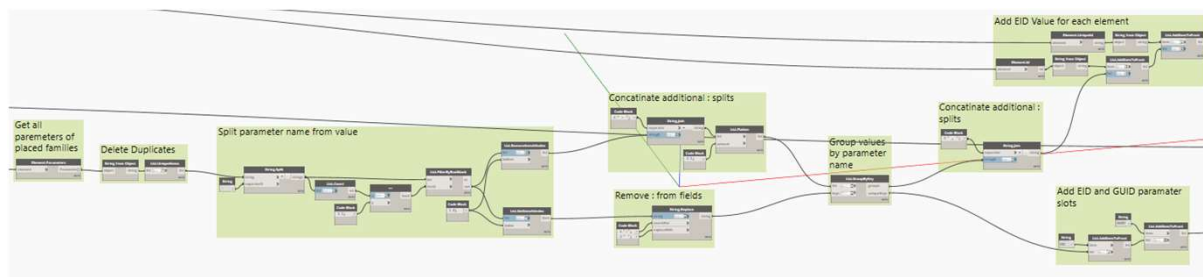

Thornton Tomasetti

23

23

SCRIPT 2 | SHEET / VIEW

- Center of the graph is identical to the elements graph

Thornton Tomasetti

24

24

SCRIPT 2 | WARNINGS

- Use GetWarnings node to collect warnings
- Extract the severity and descriptions
- Reformat the list
- Creating dictionary, JSON format, and file export are the same

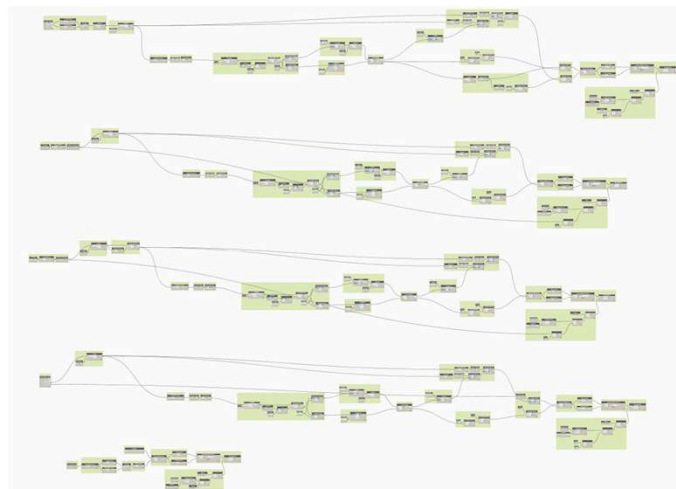

Thornton Tomasetti

27

27

SCRIPT 3 | ALL

- For ease of use all the scripts can be combined

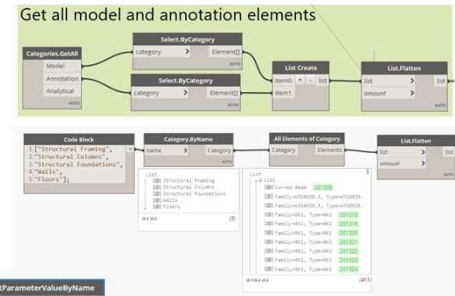

Thornton Tomasetti

28

28

SCRIPT 2 | CUSTOMIZING THE SCRIPT

- Speed
 - Limit the extraction to model or annotation elements
 - Limit the extraction by category
- Consistency
 - Limit the extraction to specific parameters

Thornton Tomasetti

29

29

EXPANDING THE SCRIPT(S)

- Elements in view
- File/ Project level info
- Loaded, unplaced content
- Overlapping elements
- Geometry data

Thornton Tomasetti

30

30

31

WHY POWER BI?

Shifts focus from processing to consuming / interpreting data

TT delivers data via Power BI platform

Desktop

- Consistently clean and process model data automatically
- Powerful beyond Excel...and Revit UI sucks for analysis
- Desktop App is free and comes with most features (try before buying Pro)
- Self-service tool empower users, does not require process ownership

Pro (and higher)

- Collaborative features - web-based and centralized access (single source of truth)
- Integrates well with Microsoft products, especially Teams and Sharepoint
- Scheduled data refreshes to optimize workflow for end-users

Thornton Tomasetti

32

32

PREPARATION CHECKLIST

When using Power BI template...

Thornton Tomasetti

Check your version of Power BI

- Template made w/ May 2022 update
- Power BI not backwards compatible for this version, so must use this version or later

Organize JSON files into single folder

Turn off Auto-Detect Relationships

- Power BI frequently and incorrectly tries to relate tables
- Unexpected relationships can over constrain model and create refresh issues
- Turn this off (if not already turned off)
- **File > Options and setting > Options > Current File: Data Load**

Relationships

- ☒ Import relationships from data sources on first load ⓘ
- ☐ Update or delete relationships when refreshing data ⓘ
- ☐ Autodetect new relationships after data is loaded ⓘ

33

ANATOMY OF POWER BI

What the developers sees (PQ) versus what the end user sees (report editor)

Roles	Developer	End-User / Consumer
Primary Sections in Power BI	Power Query Editor <i>Transform and optimize the flow of data that all users will consume</i>	Report Editor <i>Define the intended user experience, customize the display of information</i>
Intended purpose	Process data so end users don't have to	Make reports useful and usable
Subsections	 Transform data v	<div>  Report View </div> <div> <i>Create and format visuals</i> </div> <div>  Data View </div> <div> <i>Available data as a table</i> </div> <div>  Model View </div> <div> <i>Table relationships</i> </div>

Thornton Tomasetti

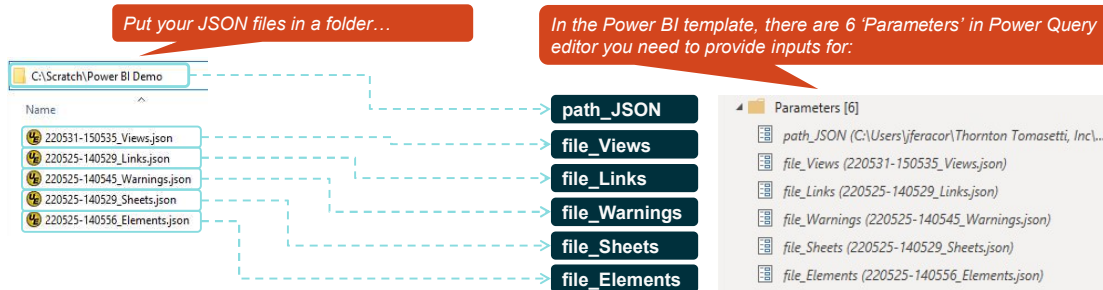

34

34

LOAD JSON DATA INTO POWER BI

New users only need to load data; advanced users may further customize

New Users:	Point the tool to the 5 JSON files in Power Query. Done!
Advanced Users:	Load more data, perform additional data transformations (e.g. joins, merges, delete unused columns, change column formatting)

Thornton Tomasetti

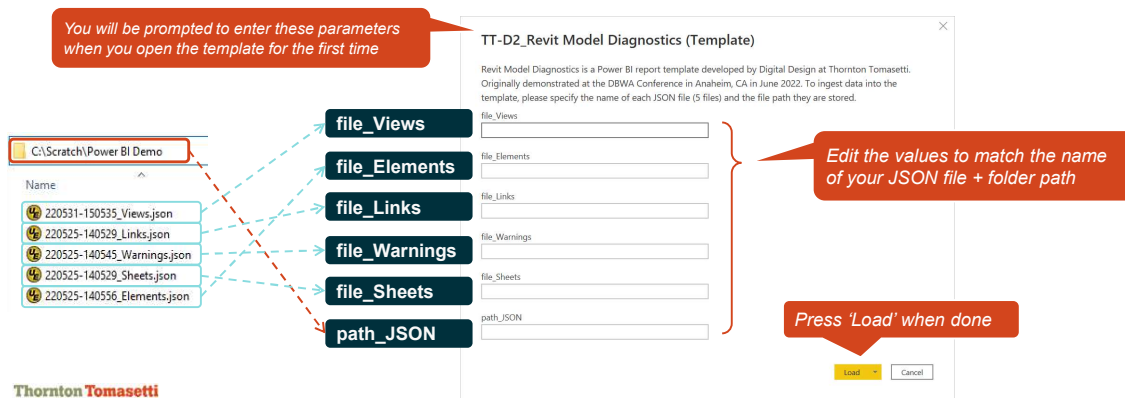

35

35

LOAD JSON DATA INTO POWER BI (CONT.)

New users only need to load data; advanced users may further customize

New Users:	Point the tool to the 5 JSON files in Power Query. Done!
Advanced Users:	Load more data, perform additional data transformations (e.g. joins, merges, delete unused columns, change column formatting)

Thornton Tomasetti

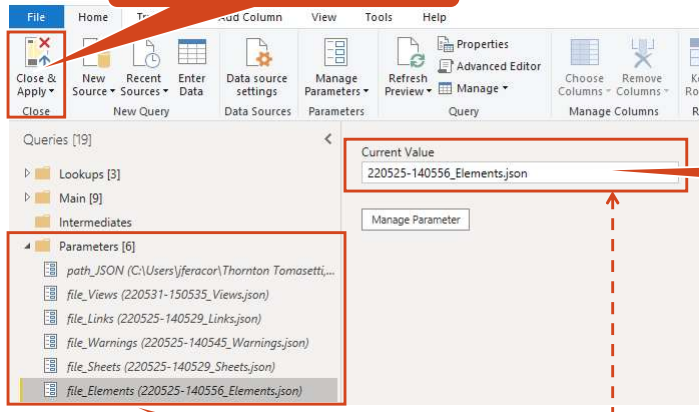

36

36

LOAD JSON DATA INTO POWER BI (CONT)

If you want to modify the parameters in the future...

(4) After updating all [6] parameters, press 'Close & Apply' (top left icon)

(2) ...then edit the value to match the name of your JSON file (or folder path)

(3) repeat step for the other 4 JSON files + the parent folder path

(1) Click on a parameter to see its current value in the pane to the right...

- path_JSON
- file_VIEWS
- file_Links
- file_Warnings
- file_Sheets
- file_Elements

Thornton Tomasetti

37

37

LOAD JSON DATA INTO POWER BI (CONT)

Query folders are optional, but help you stay organize

Main
Primary data tables used to create model + report visuals

- Views_master
- Views_explore
- Elements_master
- Elements_explore
- Elements_geometry
- summarize_geometry
- Sheets_master
- Warnings
- Links

Lookups
(Optional) for header tables. Can assist with dev

- list_headers_Sheets
- list_headers_Elements
- list_headers_VIEWS

Intermediates
(Optional) A place to put tables necessary for calculations but not needed for any specific visual. For developers.

Parameters
Parameters that allow you to swap while JSON files are loaded into the report (from previous slides)

Query Errors
Summary of errors that may have occurred when loading your data

Incoming
(Optional) Folder for new queries while in development or scratch work

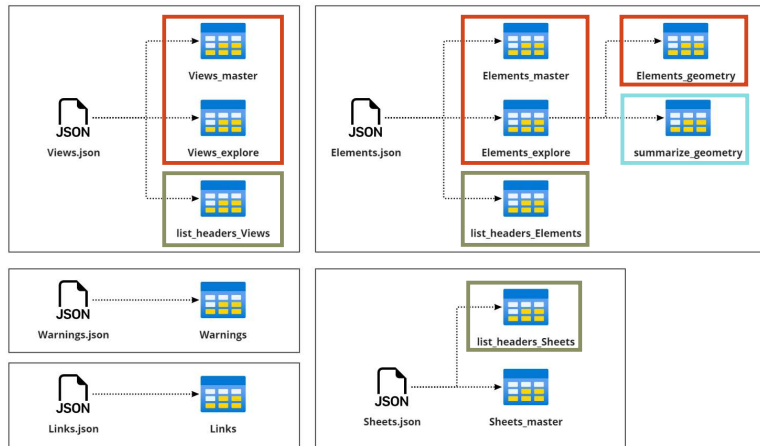

Thornton Tomasetti

38

38

JSON DATA CONTENTS

Mapping JSON to Tables

Data Cleaning Steps

- Split large tables into components
- Clean data for formatting
 - truncate multi-values cells
 - consistent values
 - consistent column headers
 - separate units from quantities
- Summarize tables for visuals

Optional (but helpful)

- Generate lists of column headers to assist with development

Thornton Tomasetti

39

39

WHY DO WE NEED TO TRANSFORM DATA?

Transformations pre-programmed in the template make data tables modular

Steps for Elements_master

- Load raw data
- Create duplicate for Elements_explore
- Remove all other columns except GUID or EID and any columns to be used as slicers for Views
- Filter any rows not needed

Steps for Elements_explore

- Remove all columns used in Elements_master except for GUID or EID
- (optional) Reformat columns (e.g. change formats to numbers, separate units from quantities, split, etc.)
- (optional) Filter any rows not needed
- (optional) replace values for consistency (handle blanks, nulls, white spaces)

All tables based on Elements should be connected to Elements_master via [EID]

Thornton Tomasetti

40

40

41

CUSTOMIZE POWER BI REPORT

Use Report Editor to align report content to specific needs of intended end users

- Use Power BI Report editor to
- Two areas of customization to focus on: **perceived usefulness, perceived usability**
 - **Perceived Usefulness:** How useful is data model + data visualizations?
 - **Perceived Usability:** Can users navigate it on their own?

Model Considerations

- Additional / alternative visualizations (details)
- Additional measures, calculated columns, or tables
- Key performance metrics
- Table relationships (cardinality and direction)

Usability Considerations

- Slider syncing / Interactivity features
- Tooltips and on-screen guidance
- Links to company-specific resources / guidance
- Buttons and bookmarks

Thornton Tomasetti

42

42

IDEAS FOR CUSTOMIZATIONS

Add branding and customize aesthetics

Branding and Aesthetics

- Users will find report more useful if it feels relevant to specific needs of company
- Display information in manner that end users expect (standard metrics?)
- Add tooltips that help users interpret what they see

Report Versioning + Control Complexity

- Create alternative versions of pages or reports with different levels of detail
- Hide details for casual users, but data available on demand

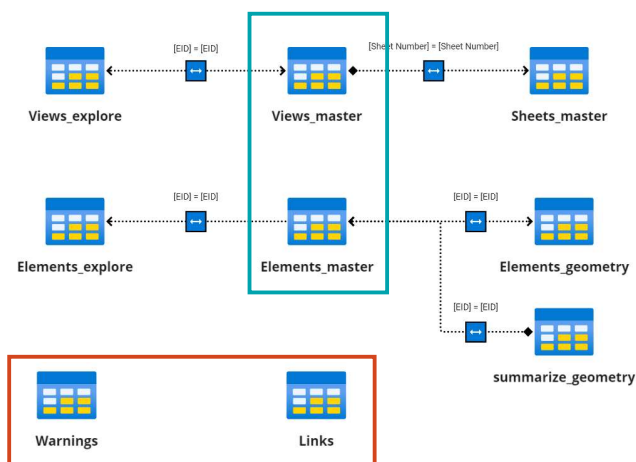

Thornton Tomasetti

43

43

DATA MODEL

For developers who want to expand on the template model

Data Model as it exists in the Power BI template

- Note that Links and Warnings tables are not connected to the model
- Future development could link elements to views and sheets they belong to
- New tables based on Elements or Views should be related to their corresponding 'master' table
 - When creating slicers for views or elements, use the 'master' table columns
 - This ensures slicers are synced across pages

Thornton Tomasetti

44

44

EXAMPLE CUSTOMIZATION #1

Add a calculated table + relate to existing model

Query: Which element types have over 200 elements in the model?

Solution: Create calculated table to filter elements table by the number of elements per category, then use as slicer.

1. Add Calculated Table w/ DAX

	<pre> summarize_type = SUMMARIZE(Elements_master,[Type], "Elements", COUNT(Elements_master[EID])) </pre>

2. In Model View, relate summary table to master table on [Type] field (both directions)

Thornton Tomasetti

45

45

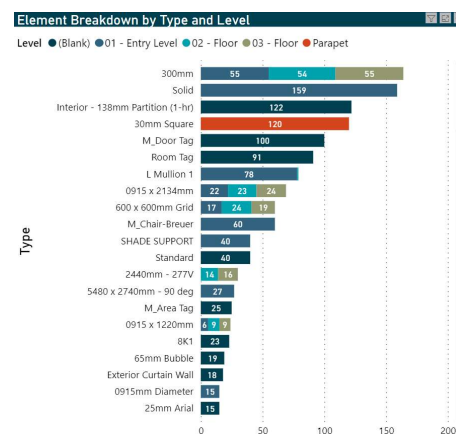

EXAMPLE CUSTOMIZATION #1

Add a calculated table + relate to existing model

Query: Which element types have over 200 elements in the model?

Solution: Create calculated table to filter elements table by the number of elements per category, then use as slicer.

ANSWER:
108 types w/ <200 elements
3 types w/ 200+ elements

Thornton Tomasetti

46

46

EXAMPLE CUSTOMIZATION #2

Add a drill through page

Query: What is the distribution of elements by Level for a selected Workset?

Solution:

Create drill-through page with specific view user expecting

Back button automatically created when you add a field to Drill Through

2. Under 'Drill through':

- Turn 'Keep all Filters' on
- Add 'Elements_master'[Workset] to filter (MUST be column as table)

1. Create a new page
Make sure it is hidden
(I called mine "DT-Example")

Level	Families	Types	Categories	Elements	Pct (%)
01 - Entry Level	4	5	3	3,557	96.8%
02 - Floor	2	2	2	96	2.6%
03 - Floor	2	2	2	19	0.5%
03 - Floor	1	1	1	1	0.0%
Total	7	8	6	3,673	100.0%

ThorntonTomasetti

47

EXAMPLE CUSTOMIZATION #2

Add a drill through page

Query: What is the distribution of elements by Level for a selected Workset?

Solution:

Create drill-through page with specific view user expecting

Right click a Workset, then select 'Drill Through'

Dynamically see detailed breakdown of a selected Workset like this

From 'Element Summary' page

'Hidden' Drill Through page ('DT-Example')

Workset	Elements	Pct (%)
Shell	3,673	56.8%
Curtain Wall Mullions	2,460	38.1%
Curtain Panels	1,189	18.4%
Walls	18	0.3%
Doors	4	0.1%
Ceilings	1	0.0%
Roofs	1	0.0%
Workset1	2,044	31.6%
Curtain Wall Mullions	816	12.6%
Curtain Panels	352	5.4%
Structural Columns	176	2.7%
Walls	162	2.5%
Furniture		

Level	Families	Types	Categories	Elements	Pct (%)
01 - Entry Level	4	5	3	3,557	96.8%
02 - Floor	2	2	2	96	2.6%
03 - Floor	2	2	2	19	0.5%
03 - Floor	1	1	1	1	0.0%
Total	7	8	6	3,673	100.0%

ThorntonTomasetti

48

49

ADVANTAGES AND LIMITATIONS

Consider the opportunity costs of your deployment

	Advantages	Limitations
General Points	<ul style="list-style-type: none"> Scripts are self-service, on demand Small footprint (JSON files) Engaging interactive reports, rapid turn-around Ability to add company-specific user guidance Minimal focus on data processing 	<ul style="list-style-type: none"> Cannot fully automate execution of Dynamo yet Single model snapshot only; no comparison features
Power BI Desktop (Free Only)	<ul style="list-style-type: none"> Automatic, consistent, repeatable transformations Source data unmodified by process Allow users to export filtered data as needed Incremental development 	<ul style="list-style-type: none"> No publishing, collaboration features Does not leverage best features of Sharepoint Sub-optimal workflow for end users, who must refresh data each time (takes time to re-calculate)
Power BI Pro (or higher) <i>ADVANCED TOPICS</i>	<ul style="list-style-type: none"> Web-based platform, centralized sharing Dataflows + scheduled refreshes Collaboration: Publishing, Teams integration Row-based security, incremental refresh 	<ul style="list-style-type: none"> Complex merges cannot be done without Premium level (but there are workarounds!) JSON files are not centrally managed (no tracking)

50

STRUCTURE YOUR FILES AND FOLDERS

How to repeat this analysis consistently, improve workflow automation

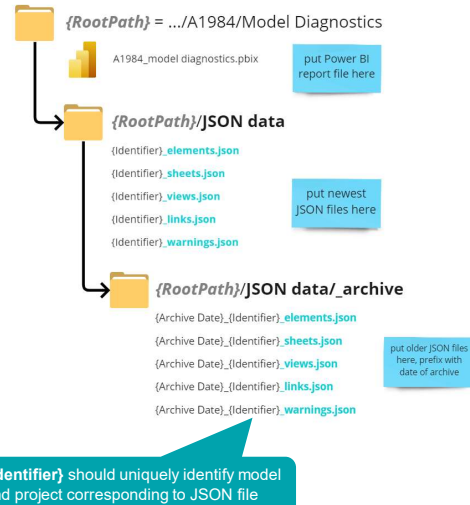

Why do this?

Stronger naming / structure conventions enables tools like Power BI to locate and distinguish JSON files intelligently

• Develop folder structure and naming system

- Allows Power BI to programmatically find JSON files by version, project, model based on path and file name
- Date stamp older data (YYYYMMDD)
- Separate data from dashboards
- Make most current file name consistent
- Allows for future expansion

Thornton Tomasetti

51

51

PUBLISH AND SHARE

How to repeat this analysis consistently, improve workflow automation

Why do this?

Publishing and refresh automation are among the most useful features of Pro in terms of workflow efficiency and optimizing the end user experience

• Publish your Dashboard to a workspace

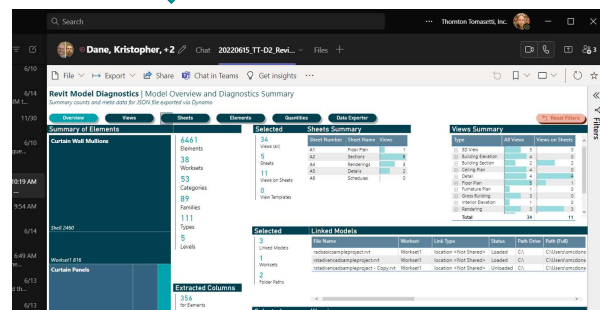

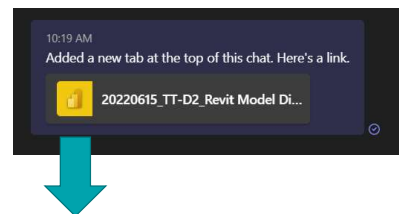

- Provide users access to workspace
- Provide users persistent link to report (or just have users log in to web platform)
- Pin Power BI report to Microsoft teams

• Use dataflows, schedule refreshes

- Pre-calculates data for dashboards to reduce load time for end users (more efficient)

Thornton Tomasetti

This template is a good example of where the cost of Power BI Pro is justifiable!

52

LEVERAGE POWER AUTOMATE

How to repeat this analysis consistently, improve workflow automation

Why do this?

Save time and reduce clerical reduce errors by automating data transfer and file renaming tasks

• Use Power Automate for File Management

- Comes with Office 365 if you have it
- Now allows connections to offline source (with proper credentials)
- Move and rename files based on logic
- Could also be done with Task Scheduler and PowerShell if you have the skills!
- Can be combined with Microsoft Forms to further automatic intake process

1. Create an 'Incoming' Folder

2. Establish a new connection to your folder in Power Automate + validate credentials

3. Create flow logic (not covered in this slide deck):

- Trigger if new file added to Incoming folder
- Check if files exist in destination folder
 - If files exist
 - prefix file name with current date in ISO format (YYYYMMDD)
 - Move renamed files to _archive folder
 - Otherwise
 - Move new files from Incoming to destination folder

4. Test flow by dropping off JSON files in Incoming Folder

Thornton Tomasetti

53

53

FURTHER DEVELOPMENT

What features would be universally beneficial to all users?

• Allow report to handle multiple snapshots, models

- You need more data columns that distinguish which model, which snapshot, and which project
- See folder structure recommendations

• Key Performance Indices (KPI) – can we summarize a model's quality with a single number?

- Define thresholds that should cause concern to modeler or BIM manager (e.g. too many line styles? Too many views not on sheets?)
- Metric allows you to track model health over time and across projects/models on demand

Thornton Tomasetti

54

54

YOUR HOMEWORK

55

YOUR HOMEWORK

Getting started on your own

- Download file from GitHub Repo (see QR code)
 - Power BI Template
 - Dynamo Scripts
 - Additional Resources for Devs
- [Do the Preparation Checklist](#)
- Run Dynamo on a model
 - Save JSON files in a folder
- Configure Template
 - Update parameters to JSON files + path
- Refresh Data!
- Optional Next Steps
 - Customize Template
 - Develop Roadmap

[GitHub Repo](#)

Thornton Tomasetti

56

56

WHAT'S IN THE GITHUB REPO?

Table of Contents

- **Power BI reports** (where Power BI template is stored)
- **Power BI Data**
 - Where you should put your JSON files
 - Includes a sample set to help you start
- **Sample Models** (Revit model used in demo)
- **Dynamo Scripts** (Dynamo scripts to be run on Revit models)
- **Resources**
 - Handouts / Notes
 - This slide deck

58

JSON DATA CONTENTS

How/why split big tables into smaller ones?

May need to apply 2 sets of filters to get different results simultaneously

Master table allows for centralized slicing of two related tables

Separate data by formatting (quantitative vs qualitative)

Easiest way to invite users to create custom tables

JSON file as table

Elements_master

Elements_explore

Custom Table = Elements_master + Elements_explore

create new report tables containing only the columns you need from Elements_explore

Elements_master

Elements_geometry

Custom Table = Elements_master + Elements_geometry

can also perform aggregation to sum blue columns along unique combinations of values in master table (yellow)

Thornton Tomasetti

59

59

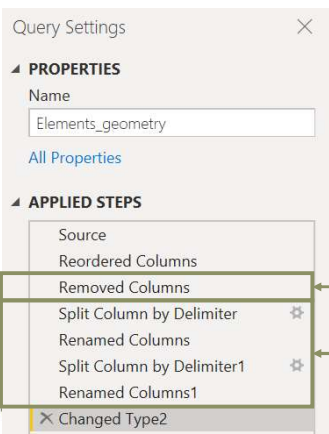

DATA LOADING ISSUES

Issue

Elements_geometry, Elements_explore, or summarize_geometry tables are loading data incorrectly

Explanation

Template tries to generalize steps, but your model contains attributes not included in template (particularly quantitative values)

To fix Elements_geometry...

In the step, 'Removed Columns', make sure that the column you are looking for was not removed

If the column has both units and value in the cell, you will need to split this column by a delimiter (usually a space), then rename the columns...

	Area	
Valid	100%	
Error	0%	
Empty	0%	
1	184 m²	
2	97 m²	

	Area_c	Area_units	
Valid	100%	Valid	100%
Error	0%	Error	0%
Empty	0%	Empty	0%
56 distinct, 33 unique		1 distinct, 0 unique	
1	184	m²	
2	97	m²	

60

DATA LOADING ISSUES (CONT.)

Issue

Elements_geometry, Elements_explore, or summarize_geometry tables are loading data incorrectly

PROPERTIES
Name
summarize_geometry
All Properties

APPLIED STEPS

- Source
- Filtered Rows
- Demoted Headers
- Transposed Table
- Filtered Rows1
- Transposed Table1
- Promoted Headers
- Reordered Columns1
- Reordered Columns
- Unpivoted Columns
- Split Column by Delimiter
- Changed Type1
- Renamed Columns
- Removed Other Columns

To fix Summarize_geometry
Insert step after the 'Filtered Rows' step to remove any rows that you do not want to appear in the summary list

Add a new 'Unpivot Columns' step and unpivot only the columns you want to be summarized, then delete the old 'Unpivot Columns' step

Split the columns as needed to separate units from the value (cannot do math otherwise) + remove any remaining unwanted columns or rows

61

DATA LOADING ISSUES (CONT.)

Issue

Power BI is looking for a column that does not exist in the JSON files

Explanation

Power BI is trying to generalize steps from the template to your specific data, but certain columns are missing from the JSON file

```
220528-070523_VIEWS.json
[
  {
    "New Column": "",
    "View Template": "None",
    "View Purpose": "Coordination",
    "PA-VIEWSERIES": "S02 SERIES - PARTIAL PLANS 1/8\" = 1'-0\"",
    "Parts Visibility": "Show Original",
    "Range Base Level": "None",
    "Referencing Detail": "2"
```

How to Fix?

(Recommended) add a new column to the JSON file; this will allow Power BI to continue, but the column values will be all empty

Better than trying to find every instance of it in Power BI...

62

DATA LOADING ISSUES (CONT.)

Issue	Dyanmo files updated to add new data, but Power BI doesn't recognize new columns in Element-related tables
Explanation	Template does not include the new columns, so it will simply skip importing them.

Advanced Editor

Elements_master

```

1 let
2     Source = Json.Document(File.Contents(path_350M\\"File_Elements")),
3     *Converted to Table* = Table.FromList(Source.SheetNames, null, null, false),
4     *Expanded Columns* = Table.ExpandRecordColumn(*Converted to Table*, "Column", {"EID", "GUID", "View Template",
        "Workset", "Category", "Family", "Type", "Type ID", "Family and Type", "Sheet Name", "Sheet Number", "Design
        ...
        "Volume", "Wall Join Display", "Width", "Work Plane", "y Justification", "y Offset Value", "Young modulus",
        "Young modulus X", "Young modulus Y", "Young modulus Z", "yz Justification", "z Justification", "z Offset Value"}),
5     *Removed Other Columns* = Table.SelectColumns(*Expanded Columns*, {"EID", "GUID", "View Template", "Workset",
        "Category", "Family", "Type", "Type ID", "Family and Type", "Sheet Name", "Sheet Number", "Design Option",
        "Dependency", "Description", "Discipline", "Base Level", "Level"}),

```

Add/remove rows or columns as necessary

How to fix:

Edit all table queries prefixed with Elements_ in PQ Editor. In the Advanced Editor within PQE:

In Advanced Editor within the 'Expanded Column' step, add the new column name at the end of the comma-separated list

(add column name at the end, e.g.

... "z Offset Value", "NewColumnName")

EXAMPLE CUSTOMIZATION #3

Add a new measures and calculated columns

Query: How many views appear in sheets?

Solution: 3 different ways of getting this, but different use cases!

Option 1: 'Lazy' Solution

1. Use Views_master table
2. Count distinct sheet numbers and view names
3. Use filter to remove "---" from results. Done!

Why is this 'lazy'?

- For this calc to work, we manually set the filter to remove "---"
- What if the user wants to see all the views but also see the number of Views on Sheets? Too bad.
- What if we just want a single button to quickly filter to views on a sheet (all of them)? Also, too bad.

4	Unique Sheets	Sheet Number
11	Unique Views	<input type="checkbox"/> Select all
		<input type="checkbox"/> ---
		<input checked="" type="checkbox"/> A1
		<input checked="" type="checkbox"/> A2
		<input checked="" type="checkbox"/> A4
		<input checked="" type="checkbox"/> A5

View Name	Sheet Number
Typical Wall Section	A2
Section Through Main Stair Copy 1	A5
Section Through Main Stair	A2
Roofing Termination Detail	A2
From Parking Area_3pm	A4
Detail At Parapet	A2
Detail At Grade	A2
Detail 0	A5
03 - Floor Public - Night Rendering	A4
03 - Floor Public - Day Rendering	A4
01 - Entry Level	A1

ADVANCED TOPIC

EXAMPLE CUSTOMIZATION #3

Add a new measures and calculated columns

Query: How many views appear in sheets?

Solution: 3 different ways of getting this, but different use cases!

Option 2: Column Calc + Measure

1. Create a calculated column in View_master that indicates Yes/No if a view is on a sheet
2. Create a measure in View_master that counts rows where [Category] = "Views" and [Sheet Number] is NOT "---"

Do we need both?

Yes, if you want to calculate the total views on sheets REGARDLESS of what filters are selected.

For example, if you filter out Sheet A2, you may want to know the SELECTED number of sheets on views versus the TOTAL number of sheets on views.

```
IsViewOnSheet = IF(
    Views_master[Sheet Number] <> "---",
    "Yes", "No"
)
```

```
num_views_on_sheets = CALCULATE(
    COUNTROWS(Views_master),
    FILTER(ALL(Views_master),
        Views_master[Category] = "Views" &&
        Views_master[Sheet Number] <> "---"
    )
)
```

EXAMPLE CUSTOMIZATION #3

Add a new measures and calculated columns

Query: How many views appear in sheets?

Solution: 3 different ways of getting this, but different use cases!

Option 2: Column Calc + Measure

1. Create a calculated column in View_master that indicates Yes/No if a view is on a sheet
2. Create a measure in View_master that counts rows where [Category] = "Views" and [Sheet Number] is NOT "---"

Are there other ways?

Yep! Can create a calculated column in Sheets_master to find the total number of views per sheet (rather than Views_master) table, then add these numbers.

Advantageous b/c it gives you the views PER sheet as a filterable column, rather than a dynamic calculation (which cannot be used as a slicer).

YES/NO Column allows us to select ALL views on sheets (rather than individually)

No	22	Unique Views
17		
Views		
Yes		
6		
Views		

IsViewOnSheet

☒ Select all

☒ No

☒ Yes

11

num_views_on_sheets

View Name	Sheet Number	IsViewOnSheet
(3D - Sean_McDonald)	---	No
(3D)	---	No
01 - Entry Level	---	No
01 - Entry Level	A1	Yes
01 - Entry Level - Furniture Layout	---	No
02 - Floor	---	No
03 - Floor	---	No
03 - Floor Public - Day Rendering	A4	Yes
03 - Floor Public - Night Rendering	A4	Yes
Balcony View	---	No
Building Courtyard	---	No
Courtyard Elevation - South Wing	---	No
Detail 0	A5	Yes
East	---	No

Sheet Number	Sheet Number	Count of View Name
<input checked="" type="checkbox"/> Select all	---	17
<input checked="" type="checkbox"/> A1	A1	1
<input type="checkbox"/> A2	A4	3
<input checked="" type="checkbox"/> A4	A5	2
<input checked="" type="checkbox"/> A5	Total	22

When A2 is filtered out, only 6/11 views on sheets remain
